2 Stau Production and Propagation

3 Stau Detection

◆□ > ◆□ > ◆三 > ◆三 > 三 のへで

Idea

- $\bullet\,$ Cosmic neutrinos reach energies $\gtrsim 10^{11}\,GeV$
- Interactions with nucleons in the Earth: $\sqrt{s} \sim 1$ TeV for $E_{\nu} \sim 10^{6}$ GeV
- Production of SUSY particles possible
- → Detection of SUSY via cosmic ray observations?

Idea

- $\bullet\,$ Cosmic neutrinos reach energies $\gtrsim 10^{11}\,GeV$
- Interactions with nucleons in the Earth: $\sqrt{s} \sim 1$ TeV for $E_{\nu} \sim 10^{6}$ GeV
- Production of SUSY particles possible
- → Detection of SUSY via cosmic ray observations?

Problem:

- Heavier particles decay to LSP immediately
- LSP neutral ⇒ not observable

Idea

- Interactions with nucleons in the Earth: $\sqrt{s} \sim 1$ TeV for $E_{\nu} \sim 10^{6}$ GeV
- Production of SUSY particles possible
- → Detection of SUSY via cosmic ray observations?

Problem:

- Heavier particles decay to LSP immediately
- LSP neutral \Rightarrow not observable

Loophole: Long-lived charged NLSP ($\tilde{\tau}_1$)

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

The Scenario

- Gravitino is the LSP
- Only gravitational interaction
- \Rightarrow Long-lived NLSP:

$$\frac{L}{2R_{\oplus}} \approx \left(\frac{m_{\tilde{\tau}}}{100 \text{ GeV}}\right)^{-6} \left(\frac{m_{3/2}}{400 \text{ keV}}\right)^2 \left(\frac{E_{\tilde{\tau}}}{500 \text{ GeV}}\right)$$

 \Rightarrow Can traverse the whole Earth

The Scenario

- Gravitino is the LSP
- Only gravitational interaction
- \Rightarrow Long-lived NLSP:

$$\frac{L}{2R_{\oplus}} \approx \left(\frac{m_{\tilde{\tau}}}{100 \text{ GeV}}\right)^{-6} \left(\frac{m_{3/2}}{400 \text{ keV}}\right)^2 \left(\frac{E_{\tilde{\tau}}}{500 \text{ GeV}}\right)$$

- \Rightarrow Can traverse the whole Earth
- R-parity ⇒ Staus produced in pairs
- High energy ⇒ Nearly parallel tracks, separation few m to few km
- ⇒ Detectable in neutrino telescopes Albuqueraue, Burdman, Chacko, PRL 92 (2004)

Motivation from Cosmology

Constraints on the LSP:

- Observed dark matter density
- Big Bang Nucleosynthesis
- Distortions of the Cosmic Microwave Background
- ~ Bounds on gravitino mass and reheating temperature

More restrictive for unstable gravitino

→ Favored scenario:

- Stable gravitino LSP
- Slepton NLSP

Stau Energy Loss

$$-\left\langle \frac{\mathsf{d}\boldsymbol{E}}{\mathsf{d}\boldsymbol{x}}\right\rangle \propto \alpha+\beta\boldsymbol{E}$$

- α due to ionization
- β due to radiative processes
- $\beta E \gg \alpha$ for muons with $E \gtrsim 500 \text{ GeV}$

Stau Energy Loss

$$-\left\langle \frac{\mathrm{d}E}{\mathrm{d}x} \right\rangle \propto \alpha + \beta E$$

- α due to ionization
- β due to radiative processes
- $\beta E \gg \alpha$ for muons with $E \gtrsim 500 \text{ GeV}$
- $\beta_{\widetilde{\tau}} \approx \frac{m_{\mu}}{m_{\widetilde{\tau}}} \beta_{\mu} \Rightarrow$ Stau range much larger
 - \Rightarrow Can compensate for smaller production cross section
- Detailed calculation: Reno, Sarcevic, Su, Astropart. Phys. 24 (2005)

Waxman, Bahcall, Phys. Rev. D59 (1999)

 \Rightarrow Staus subdominant compared to muons in detected spectrum

Stau Pair Event Rate

- Expected signature: 2 parallel muon-like tracks
- Estimate for detection efficiency:
 - Cutoff at low energy: $E_{\widetilde{ au}} > 500 \text{ GeV}$
 - 50 m < separation < 1 km
- Background:
 - Coincident muons:
 - \sim 12 orders of magnitude below muon flux
 - Muon pairs from $\nu_{\mu} + N \rightarrow \mu + H \rightarrow \mu + \mu + \nu_{\mu} + H'$: Separation < 50 m due to small range of muons

Stau Pair Event Rate

Stau Detection

Stau Pair Event Rate

Number of events at IceCube for Waxman-Bahcall fluxmin \widetilde{m} : 5 per yearSPS 7: 1 per decade

For Comparison

Albuquerque, Burdman, Chacko, hep-ph/0605120

Number of events per km² with Waxman-Bahcall flux:

- ~ min \widetilde{m} : 14 (12?) per year
- \sim SPS 7: 1 per year

Possible reasons for the discrepancy:

- Calculation of track separation
- Relation between stau energy and initial neutrino energy
- Neutrino propagation in the Earth

Stopped Staus

- Low-energy staus stop in the detector
- Decay later $\rightsquigarrow \tau$ cascade
- Correlation with track ending in the detector
- $\bullet\,$ Observable at IceCube for lifetimes \lesssim few hours

<ロ> (四) (四) (三) (三) (三) (三)

Stopped Staus

- Low-energy staus stop in the detector
- Decay later $\rightsquigarrow \tau$ cascade
- Correlation with track ending in the detector
- $\bullet\,$ Observable at IceCube for lifetimes \lesssim few hours

Conclusions

- Gravitino LSP + stau NLSP attractive for cosmology
- $\bullet\,$ Cosmic ray interactions in the Earth \leadsto stau pairs
- Detectable in neutrino telescopes
- Small event rates in km³ detector for "realistic"
 SUSY-breaking scenarios and cosmic neutrino flux
- Several events per year possible, if superparticles lighter or neutrino flux larger than expected
- LHC will probably discover SUSY earlier
