

Supernova monitoring with **SNO** and **SNEWS**

Fabrice Fleurot, Laurentian, Sudbury

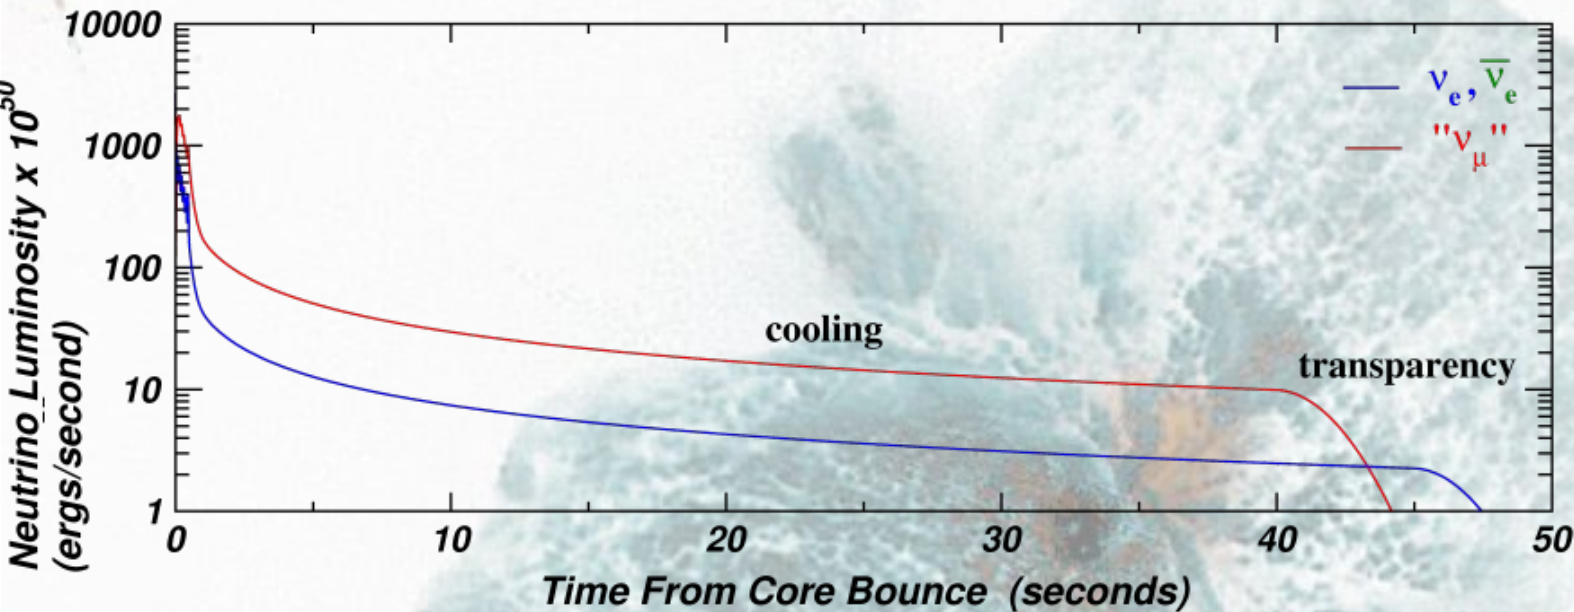

- SNO overview
- Type II supernova neutrinos in D_2O and H_2O
- The supernova trigger system
- SNEWS, the SuperNova Early Warning System

SNO, some numbers

- J. Maneira told (almost) everything last Monday
- 1,000 t D_2O , we know, but also 1,700 t H_2O seen by the PMTs
- Hardware buffer for 1M events

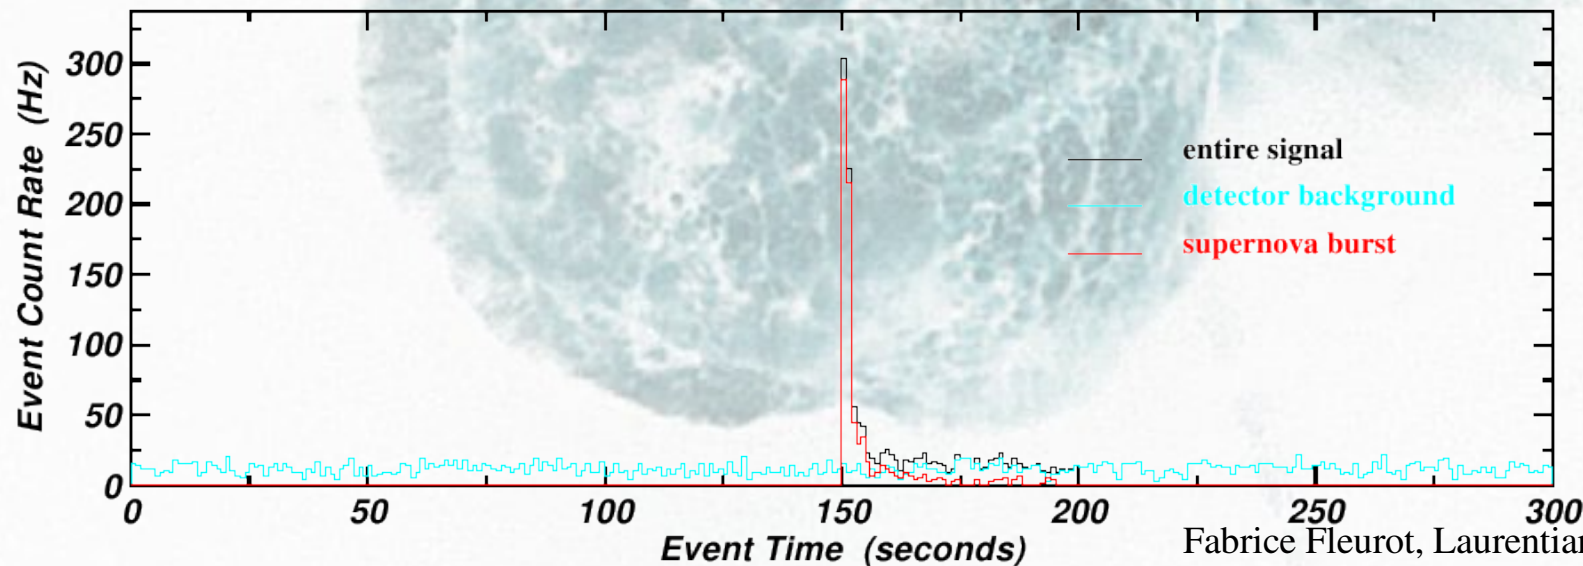

A search for neutrino bursts

Burrows' model
~60% 1 s
Beacom & Vogel:
~30% 1s

generic "burst"
threshold:
> 50%/2s

BG: 1-3/min
at 3.8 MeV

Signal in SNO
Monte Carlo by
J. Heise

Main SN reactions in SNO

- H₂O, charged current (40%)

- D₂O, charged current (25%)

- D₂O, neutral current (30%)

- both, elastic scattering (5%)

How many events?

- For a 10-kpc away supernova (10^{58} neutrinos):
 - 900 reactions in 1 min in SNO. Once folded with efficiency:
 - 600 in the pure-D₂O phase ($\varepsilon = 30\%$ for neutrons),
 - 800 in the dissolved-salt phase (85%),
 - 700 in the NCD phase (57%).
 - For our 50%-in-2 s threshold: 50-75 events from at the far edge of the Galaxy
 - > Chose a **30/2 s** threshold, where “background bursts” still rare

SNO Real-time automated SN analysis

Looking for bursts of interests

“3+1” levels, on Red Hat Linux machines

- **Level 1:** ≥ 35 **PMTs** events (**3.8 MeV**) from datastream stored in a circular buffer.
- If ≥ 30 such events in sliding **2 s** windows: Level-2 is called.

SNO Real-time automated SN analysis

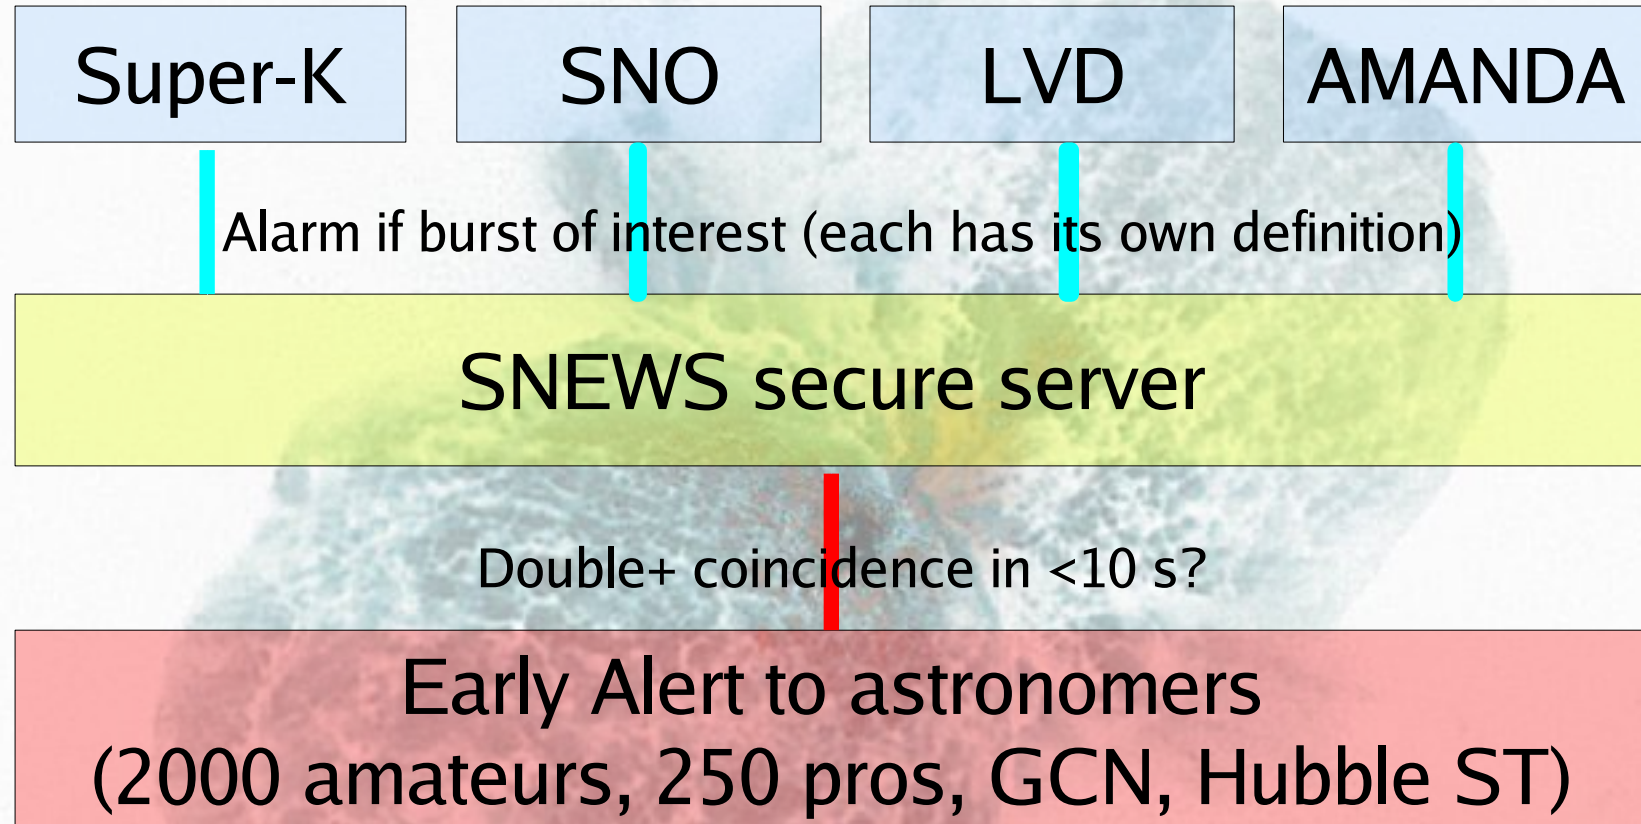

- **Level 2:**
Automated analysis, data cleaning cuts:
 - similar to Solar analysis (rm flashers, electrical, light, spallations...), no fiducial volume.
 - burst identification
 - Analysis summary e-mailed to SN working group.
- If **>35%** survival, calls Level-3

SNO Real-time automated SN analysis

- **Level 3:**
 - Event reconstruction;
 - SN direction $\pm 25^\circ$ (from elastic scattering);E-mails, text msg, auto phone to SN groups -> conference call
 - **Final tests** on burst:
 - Isotropy, D_2O/H_2O event ratio ($\sim 50/50$), high-rate (>2 b in 9h?)...
- If passed: automated alarm to outside world (**SNEWS**); followed by manual confirmation (or retraction).
- So far: 0 false alarm from SNO!

SNEWS: SuperNova Early Warning System

Neutrinos arrive hours before photons!

Alarm if burst of interest (each has its own definition)

SNEWS secure server

Double+ coincidence in <10 s?

Early Alert to astronomers
(2000 amateurs, 250 pros, GCN, Hubble ST)

- The 3+1 Ps:

Prompt, **P**ointing (amateurs), **P**ositive (<1 false/100y => <1/10d/detector)

Privacy (PGP, highly-secure network at BNL)

What to expect for the future?

- The SNO SN system should be adapted to SNO+
- SN-specific ν detector at SNOLab (HALO)
- SNEWS must grow: you are welcome to join us:

<http://snews.bnl.gov>

Burst History

- **Level 2:** (>35 PMT, >30 ev / 2s)
~25,000 bursts/year, mostly in calibration, maintenance
- **Level 3:** (>35% survival)
very conservative => 1,500 bursts/y (94% efficiency)
30 b/y off calibration/maintenance (mostly dying PMTs)
- **Final tests** to SNEWS:
0!
Isotropy and D_2O/H_2O tests are very effective
